CW1 — Individual Contribution Report

Student name	**Mohamed Rahil Mubarak**
Student ID	W2182390
Group number	4
Project theme	Lego Zoo Project
GitHub individual folder	https://github.com/rahilmubarak12/CW1-LEGO-Zoo-Individual/tree/main

1. My role and contribution

The major task which I have had to undertake in the LEGO Zoo project is the designing of the entrance of the zoo. The design that I was supposed to create includes a 3D model of the entrance of the zoo made up of LEGO. In addition to ensuring that the design adhered to the LEGO theme, the other objective that I set myself in designing the entrance of the zoo was to ensure that it was appealing to visitors.

2. Development process and technical work

- Research: I did research on LEGO modelling software such as LeoCAD and Mecabricks as well as how to import their models to Unity.
- AI assistance: In order to avoid wasting any time on development, I used Claude to assist me to develop a Unity Editor script to develop the empty LEGO environment.
- My own contribution: After developing the LEGO environment, I was able to design and add the entrance of the zoo which included the ticket counter and other decorative items.
- Testing and improvements: The environment was tested in Unity and any necessary adjustments were made to fit the LEGO Zoo project requirements.

3. Visual evidence

As shown by the first screenshot below, the entire entrance environment to the LEGO Zoo is captured in this picture. The entrance environment includes a big “ZOO” sign which is mounted between the two flag towers. There is a pathway marked with animal footprints leading visitors to the entrance. The surroundings of the entrance environment have trees, colorful flower beds, fences, minifigures, ticket counter, and a big elephant.

Screenshot 2 is the picture of the same counter but closer to it. This particular counter is situated on the left side of the entrance to the zoo. It has a roof of red color, a yellow sign “tickets” and a strip of red and white colors. In addition, there are two LEGO minifigures on the counter as if they are buying their tickets.

In the third screenshot, a LEGO security guard can be seen placed close to the entrance gate of the zoo.This guard is placed next to the fenced entrance area. He represents those security guards who are in charge of monitoring all the visitors coming to the zoo.

4. Collaboration and reflection

In CW2, my objective is to improve upon my entrance design by adding interactive elements such as an automatic entrance gate, ticket counter and security guard which can engage in dialogue with visitors.

5. AI assistance: disclosure and critical reflection

When developing my LEGO Zoo Entrance project, Claude AI was used to help me write a Unity Editor script to build the initial environment, mostly to save time. Nonetheless, I developed the environment on my own by adding such elements as the ticket counter, some trees, the security guard, and others. Also, I tried out the environment in the Unity editor and modified it according to our project's needs. It allowed me to see how AI may help in the development process but still require human efforts at the same time. One issue with using AI to generate code is that sometimes the generated code may not work as expected. Thus, verification is required in such cases.

6. AI transcript archive and summary
