Module Leader : Pumudu Fernando

Individual Contribution Report

Student Name	Travis Henry Joachim
UOW ID	w2120789
IIT ID	20232288
Tutorial Group	G8

1. Overview of my contribution

My main contribution to the group project was creating the security checkpoint model, the monkey enclosure model and turning it into a combined zoo environment into a playable first-person demo in Unity. My work covered both visual environment and the practical gameplay setup, so that the player could move through the zoo and view the models created by the group.

2. Security Checkpoint Modeling

I was responsible for modeling the security checkpoint. This was created using Mecabricks.

3. Monkey Enclosure Modeling

I was also responsible for creating the monkey enclosure. The design follows an open-air zoo enclosure concept. This was created using LeoCAD.

4. Unity Implementation and Environment Setup

I brought the group's exported 3D models into the Unity project and arranged them within the same playable zoo environment. This included positioning every model in a way so that the player could travel through the environment in a logical order

Collision setup

I added Box Collider components to all the environment's objects so that the player would not fall through the map or pass directly through objects. This was an important part of making the scene navigable.

First player controls

I worked on the first-person player setup, including the camera view and the movement controls. The player can run using the SHIFT KEY and jump using the SPACE KEY and move using the W, A, S, D KEYS. The first person perspective allows the player to experience the zoo from the visitor's perspective.

5. Playable Demo Features and Testing

The current demo brings the group's models together in one environment. When the player selects Play from the main menu, they spawn at the entrance model created by Rahil. From there, they can move towards the security checkpoint and continue into the zoo. The Aquarium created by Jovan, the Monkey Enclosure created by me, and the Bear Enclosure created by Nathania are included in the current scene. Grey areas indicate locations reserved for additional enclosures in a later version. I tested the movement and collision setup by navigating around the environment and checking that the player remained on the map and could not walk through solid objects. The checkpoint is currently part of the environment, with ticket-checking and other interactions planned for the final build rather than implemented in this demo
